Постановка задачи

Вариант 13.

Наложить K раз фильтр, использующий матрицу свертки, на матрицу, состоящую из вещественных чисел. Размер окна задается пользователем.

Общий метод и алгоритм решения

Использованные системные вызовы:

- write() – записываем число байт из буфера в указанный файловый дескриптор
- read() - чтение данных из файлового дескриптора
- pthread_mutex_lock() – блокируем мьютекс
- pthread_mutex_unlock() – разблокируем мьютекс
- pthread_mutex_init() – инициализируем мьютекс
- pthread_create() – создаем новый поток с атрибутами
- pthread_join() – ожидаем завершение потока
- pthread_mutex_destroy() – уничтожаем незаблокированный мьютекс

Создадим структуру матрицы, куда из файла будем вводить значения из матрицы. Генерируем матрицу свертки, размер которой задается ключом программы. Создаем потоки, количество которых задается ключом. В зависимости от количества потоков делим ряды матрицы между ними, каждый поток считает свой участок матрицы и записывает результат в новую матрицу. Для наглядности работы программы, выводим информацию по каждому потоку(когда начал и когда закончил работу), чтобы потоки не мешали друг другу выводить данные используем мьютекс. Если было введено K > 1, в изначальную матрицу копируем полученную матрицу, повторяем тот же алгоритм. После сохраняем результат в файл.

Количество потоков (K)	Производительность
1	5.93c
3	5.67c
5	5.40c

Вывод

Язык Си с поддержкой библиотек позволяет создавать многопоточные приложения, предоставляя инструменты для работы с потоками и механизмы ограничения для обеспечения безопасности. Это делает разработку на Си более разнообразной и увлекательной.
